

QX26AgenticDelegation - verified dependency chain

Selected threshold mechanism; empirical identification remains outside the Lean scope

Formal boundary

Lean proves the conditional mathematical chain. It does not infer that Claude Code causally changes the threshold.

The premise $T^D < T^S$ and CDF monotonicity remain explicit at the review surface.

Presentation focus

activation_band: newly viable opportunities are exactly those between the delegation and solo thresholds.

This is the cleanest paper equation -> Lean declaration -> verified interpretation sequence.
